

Applied Data Science with Python for Beginners

Lecture 2 - 04 May 2021

What you learn today...

... work with data in a DataFrame

... filter your data

... merge, group and aggregate your data

... visualize data with simple plots

Libraries

- A collection of functions is bundled in a **library**
- we import these libraries and can use the defined functions
- Some libraries come with a Python installation, some need to be installed

matplotlib

... for plotting and visualization

pandas

... for working with tabular data (Excel-files, csv-files,...)

... creating machine learning models

Function & Methods

Functions

```
a = function_name(parameter)
```

Function & Methods

Functions

```
a = function_name(parameter)
```

Methods

```
a = "a string"  
a = a.upper() # 'A STRING'
```

Import Libraries

```
import library
```

```
library.function_name()
```

Import Libraries

```
import library as l
```

```
l.function_name()
```

NumPy - library

- Library for scientific computing
- Work with lists, matrices or higher dimensional structures
- NumPy lists have much more functionality than usual lists

```
import numpy as np  
  
a = np.array([1,2,3,4])
```

NumPy - library

- Library for scientific computing
- Work with lists, matrices or higher dimensional structures
- NumPy lists have much more functionality than usual lists

```
import numpy as np

a = np.array([1,2,3,4])
a.sum() # 10
a.mean() # 2.5
a.std() # 1.118...
```

NumPy - library

- Library for scientific computing
- Work with lists, matrices or higher dimensional structures
- NumPy lists have much more functionality than usual lists

```
import numpy as np

a = np.array([1,2,3,4])
a.sum() # 10
a.mean() # 2.5
a.std() # 1.118...
```

Documentation

- Explanations to the methods and functions
- Often include examples and tutorials
- <https://numpy.org/doc/>

The screenshot displays the NumPy documentation website. At the top, the NumPy logo is on the left, and navigation links for 'User Guide', 'API reference', and 'Development' are on the right. A search bar is positioned below the logo. The left sidebar contains a table of contents with categories like 'What is NumPy?', 'NumPy basics', 'Indexing', and 'Miscellaneous'. The main content area is titled 'Single element indexing' and includes a paragraph explaining 1-D array indexing, a code block with examples, another paragraph about multidimensional indexing, a second code block, and a concluding note.

NumPy

Single element indexing

Single element indexing for a 1-D array is what one expects. It work exactly like that for other standard Python sequences. It is 0-based, and accepts negative indices for indexing from the end of the array.

```
>>> x = np.arange(10)
>>> x[2]
2
>>> x[-2]
8
```

Unlike lists and tuples, numpy arrays support multidimensional indexing for multidimensional arrays. That means that it is not necessary to separate each dimension's index into its own set of square brackets.

```
>>> x.shape = (2,5) # now x is 2-dimensional
>>> x[1,3]
8
>>> x[1,-1]
9
```

Note that if one indexes a multidimensional array with fewer indices than dimensions, one gets a subdimensional array. For example:

NumPy - Append

```
import numpy as np
```

```
a = np.array([1,2,3,4])
```

```
np.append(a, [5,6,7]) # array([1, 2, 3, 4, 5, 6, 7])
```

NumPy - Append

```
import numpy as np

a = np.array([1,2,3,4])
np.append(a, [5,6,7]) # array([1, 2, 3, 4, 5, 6, 7])
a = np.append(a, [5,6,7])
```

Compute with arrays - Broadcasting

```
import numpy as np
a = np.array([1,2,3])
a * 2 # array([2, 4, 6])
a ** 2 # array([1, 4, 9])
a - 1 # array([0, 1, 2])
```

Compute with arrays

```
import numpy as np
a = np.array([1,2,3])
b = np.array([1,1,1])
a + b # array([2, 3, 4])
```

Indexing

```
import numpy as np

a = np.array([1,2,3,4])
a[0:2] # array([1,2])
```

Boolean Indexing

```
import numpy as np
```

```
a = np.array([1,2,3,4])
```

```
a[[True,True,False,False]] # array([1,2])
```

Boolean Indexing

```
import numpy as np

a = np.array([1,2,3,4])
a <= 2 # [True, True, False, False]
```

Boolean Indexing

```
import numpy as np

a = np.array([1,2,3,4])
a <= 2 # [True, True, False, False]
a[a<=2] # array([1,2])
```

Exercise 1

```
import numpy as np

a = np.array([1,2,3,4])
a = np.append(a, [5,6,7]) # append
a[a<=2] # boolean indexing
```

pandas DataFrame

pandas - library

```
import pandas as pd
```

```
data = {  
    "Name": ["Clara", "Tom", "Sarah", "John"],  
    "Age"  : [20, 24, 19, 21]}
```

```
df = pd.DataFrame(data)
```

	Name	Age
0	Clara	20
1	Tom	24
2	Sarah	19
3	John	21

DataFrame - data structure

Read data

- Pandas can read data from files
- Various data formats possible

```
df = pd.read_csv('path_to_file')  
df = pd.read_excel('path_to_file')  
df = pd.read_sql_table('postgres://db')
```

First look at the data

```
df.head()
```

	id	price	neighbourhood_group_cleansed	latitude
0	28684898	\$50.00	Neukölln	52.473978
1	22607348	\$10.00	Treptow - Köpenick	52.468095
2	21019199	\$35.00	Neukölln	52.481810
3	21919556	\$99.00	Pankow	52.537269
4	4820648	\$39.00	Friedrichshain-Kreuzberg	52.491483

```
df.describe()
```

	id	price	latitude	longitude	bathrooms
count	1.353100e+04	13531.000000	13531.000000	13531.000000	13508.000000
mean	1.573089e+07	70.082625	52.509956	13.405871	1.095203
std	8.580394e+06	255.451132	0.030773	0.058517	0.335469
min	2.695000e+03	0.000000	52.346203	13.103557	0.000000
25%	8.041528e+06	30.000000	52.489082	13.374950	1.000000
50%	1.697254e+07	45.000000	52.509229	13.416764	1.000000
75%	2.264464e+07	70.000000	52.532808	13.439258	1.000000
max	2.986735e+07	9000.000000	52.651670	13.721671	8.500000

Access data

Access data in a DataFrame

idx	Name	Age
0	Clara	20
1	Tom	24
2	Sarah	19
3	John	21

```
df = pd.DataFrame(data)
```

Access data in a DataFrame

idx	Name	Age
0	Clara	20
1	Tom	24
2	Sarah	19
3	John	21

```
df = pd.DataFrame(data)  
df["Name"]
```

Access data in a DataFrame

idx	Name	Age
0	Clara	20
1	Tom	24
2	Sarah	19
3	John	21

```
df = pd.DataFrame(data)  
df.iLoc[0:3]
```

Add data to a DataFrame

idx	Name	Age	Grade
0	Clara	20	1
1	Tom	24	2
2	Sarah	19	3
3	John	21	4

```
df["Grade"] = [1,2,3,4]
```

Compute with data in a DataFrame

idx	Name	Age	Grade
0	Clara	20	2
1	Tom	24	3
2	Sarah	19	4
3	John	21	5

```
df["Grade"] = df["Grade"] + 1
```

Drop data

idx	Name	Age	Grade
0	Clara	20	1
1	Tom	24	2
2	Sarah	19	3
3	John	21	4

```
# Drop column  
df = df.drop(column="Grade")
```

Drop data

idx	Name	Age	Grade
2	Sarah	19	3
3	John	21	4

```
# Drop column  
df = df.drop(column="Grade")  
  
# Drop row  
df.drop([0,1], inplace=True)
```

Filter data

Filter data - select a subset of the data

idx	Name	Age	Grade
0	Clara	20	2
2	John	21	5

```
keep_rows = [True, False,  
              True, False]
```

```
df[keep_rows]
```

Filter data - select a subset of the data

idx	Name	Age	Grade
0	Clara	20	2
1	Tom	24	3
2	Sarah	19	4
3	John	21	5

```
df["Age"] <= 20  
→ [True, False, True, False]
```

Filter data - select a subset of the data

idx	Name	Age	Grade
0	Clara	20	2
2	John	21	5

```
df[ df["Age"] <= 20 ]
```

```
[True, False, True, False]
```

Filter data - select a subset of the data

idx	Name	Age	Grade
0	Clara	20	2

```
df[
    (df["Age"] <= 20) &
    (df["Grade"] < 3)
]
```

Filter data - select a subset of the data

idx	Name	Age	Grade
0	Clara	20	2
2	Sarah	19	4

```
df[
    (df["Age"] == 20) |
    (df["Grade"] == 4 )
]
```

Exercise 2

```
import pandas as pd
```

```
df = pd.DataFrame(data) # create dataframe
```

```
df.sort_values(by='column_name') # sort
```

```
df[df['age']<=20] # filter data
```

Pandas methods

Apply pandas methods

- Pandas has large amount of commonly used methods
- Can be applied to single column or whole data frame

```
df["Grade"].mean()  
df["Grade"].std()  
df["Grade"].sum()
```

Often used methods

```
df["Grade"].mean()
```

```
df["Grade"].sum()
```

```
df["Grade"].value_counts()
```

```
df.sort_values(by="Grade")
```

```
df.groupby(by="Grade").sum()
```

```
df1.merge(df2)
```

```
df.drop(columns=["Grade"])
```

```
df["Grade"].replace(5, "Failed")
```

Group-By

idx	Name	Age	Gender
0	Clara	20	F
1	Tom	24	M
2	Sarah	19	F
3	John	21	M

What is the average age per gender?

Group-By

```
df.groupby(by='Gender').mean()
```

idx	Name	Age	Gender
0	Clara	20	F
1	Tom	24	M
2	Sarah	19	F
3	John	21	M

Group-By

```
df.groupby(by='Gender').mean()
```

idx	Name	Age	Gender
0	Clara	20	F
1	Tom	24	M
2	Sarah	19	F
3	John	21	M

Merge DataFrame's

Name	Age	Grade
Clara	20	2
Tom	24	3
Sarah	19	4

Name	Subject
Sarah	Physics
Tom	Politics
John	English

Merge DataFrame's

Name	Age	Grade
Clara	20	2
Tom	24	3
Sarah	19	4

Name	Subject
Sarah	Physics
Tom	Politics
John	English

Name	Age	Grade	Subject
Tom	24	3	Politics
Sarah	19	4	Physics

Merge DataFrame's

Name	Age	Grade
Clara	20	2
Tom	24	3
Sarah	19	4

```
df1.merge(df2, on='Name')
```

Name	Subject
Sarah	Physics
Tom	Politics
John	English

Name	Age	Grade	Subject
Tom	24	3	Politics
Sarah	19	4	Physics

Merge DataFrame's

Name	Age	Grade
Clara	20	2
Tom	24	3
Sarah	19	4

```
df1.merge(df2, how='left',  
on='Name')
```

Name	Subject
Sarah	Physics
Tom	Politics
John	English

Name	Age	Grade	Subject
Tom	24	3	Politics
Sarah	19	4	Physics
Clara	20	2	-

Exercise 3

```
import pandas as pd
```

```
df = df.groupby(by='column_name')
```

```
df = df.merge(df2, on='column_name')
```

Visualizations

matplotlib - library

- data visualization tool
- generate highly customizable plots
- good integrated with pandas

```
import matplotlib.pyplot as plt  
x = [0,1,2,3,4,5]  
y = [0,2,4,8,16,32]  
plt.plot(x,y)
```

Plot:

Histogram

```
import matplotlib.pyplot as plt  
x = [1,2,2,2,2,3,3]  
plt.hist(x, bins=3)
```

Customize plots

```
import matplotlib.pyplot as plt  
x = [0,1,2,3,4,5]  
y = [0,2,4,8,16,32]  
y2 = [0,1,2,3,4,5]  
  
plt.plot(x,y)  
plt.plot(x,y2)
```

Customize plots

```
import matplotlib.pyplot as plt  
x = [0,1,2,3,4,5]  
y = [0,2,4,8,16,32]  
y2 = [0,1,2,3,4,5]  
  
plt.plot(x,y, color='green', label='Graph A')  
plt.plot(x,y2, color='red', label='Graph B')  
  
plt.legend()
```

Customize plots

```
import matplotlib.pyplot as plt
x = [0,1,2,3,4,5]
y = [0,2,4,8,16,32]
y2 = [0,1,2,3,4,5]

plt.plot(x,y, color='green', label='Graph A')
plt.plot(x,y2, color='red', label='Graph B')

plt.legend()
plt.xlabel("X-label")
plt.ylabel("Y-label")
plt.title("Title")
```

Customize plots

```
import matplotlib.pyplot as plt
x = [0,1,2,3,4,5]
y = [0,2,4,8,16,32]
y2 = [0,1,2,3,4,5]

plt.plot(x,y, color='green', label='Graph A')
plt.plot(x,y2, color='red', label='Graph B')

plt.legend()
plt.xlabel("X-label")
plt.ylabel("Y-label")
plt.title("Title",
{'fontname':'DejaVu Sans', 'size':'20'})
plt.grid()
```

pandas & matplotlib

- Pandas and matplotlib work very well together
- We can pass columns of a DataFrame to matplotlib

```
import matplotlib.pyplot as plt  
df = pd.DataFrame(data)  
plt.hist(df["Age"])
```

Exercise 4

```
import matplotlib.pyplot as plt
x = [0,1,2,3,4,5]
y = [0,2,4,8,16,32]

plt.plot(x,y, color='green', label='Graph A')

plt.legend()
plt.xlabel("X-label")
plt.ylabel("Y-label")
plt.title("Title")
```
